Re: New Check Valve for Red Jacket 4" Submersible Pumps

Effective approximately with date code 10293, (the 1st week of February 1993), Red Jacket 4" Submersible standard, AG and Viton-type Solvent pumps will be manufactured with a check valve.

Development of the new check valve was guided by customer comments expressing a preference for the previous brass model along with consideration for the current and anticipated operating environment.

The new check valve combines the best features of both previous models and improves upon them. The upper portion of the check valve (A) will be stainless steel while the lower portion (B) will be plastic. The seal will be a Viton material, either B401 or GFLT depending on the pump model. This combination of features should extend the operating life and improve compatibility with alternative fuels.

Please make a note of the new check valve part numbers as listed below. Pricing will remain the same as the current model.

All previous model check valves (144-133-5 and 138-056-5) will be discontinued once current stock is depleted.

Standard 4" Pump	144-183-5
AG 4" Pump	144-184-5
Viton-Solvent 4" Pump	144-184-5
